Stephen Blake : Astronomy and Astrology in the Islamic World (The New Edinburgh Islamic Surveys EUP)

before purchasing it in order to gauge whether or not it would be worth my time, and all praised Astronomy and Astrology in the Islamic World (The New Edinburgh Islamic Surveys EUP):

It was the astronomers and mathematicians of the Islamic world who provided the theories and concepts that paved the way from the geocentric theories of Claudius Ptolemy in the second century AD to the heliocentric breakthroughs of Nicholas Copernicus and Johannes Kepler in the sixteenth and seventeenth centuries. Algebra, the Arabic numeral system, and trigonometry: all these and more originated in the Muslim East and undergirded an increasingly accurate and sophisticated understanding of the movements of the Sun, Moon, and planets. This nontechnical overview of the Islamic advances in the heavenly sciences allows the general reader to appreciate (for the first time) the absolutely crucial role that Muslim scientists played in the overall development of astronomy and astrology in the Eurasian world.

"a detailed yet readable account of personalities and locations linked to the use and development of algebra, the Arabic numeral system, trigonometry, and the astronomical charts known as the *zij*... which provides access to this specialized field without burdening the reader with extensive technical information." -- Mohammad Mesbahi, *Journal of Shi'a Islamic Studies* About the Author Stephen Blake is Associate Professor Emeritus at St. Olaf College, Northfield, Minnesota. His books include *Time in Early Modern Islam: Calendar, Ceremony, and Chronology in the Safavid, Mughal, and Ottoman Empires* (2013), *Shahjahanabad: The Sovereign City in Mughal India, 1639-1739* (2002) and *Half the World: The Social Architecture of Safavid Isfahan, 1590-1722* (1999).
